

Q.1 a)

A stack is a data structure which works in first in first out manner. It is used to store data in a program.

Q.1 b)

Stack and queue are both linear data structures. Stack is used more than queue.

Q.2

Binary search is a method to find an element. We check each element of the array one by one from the start till we get the element. Its complexity is $O(n)$.

Q.3 a)

BFS means we visit the nodes of a graph. We start from a node and go to its neighbour nodes.

Q.5

Hashing is used to store data in a table. There can be collision when two keys go to same place. It can be solved by chaining.
