

Name: Karan Mehta Roll No: CS22-045

1(a) A stack is a linear data structure following LIFO (Last In First Out) principle - the last element pushed is the first one popped.

Continuing 1(a): Applications include function call stacks, undo/redo in editors, expression evaluation, and backtracking algorithms.

1(b) Stack uses LIFO (push/pop from one end), Queue uses FIFO (enqueue at rear, dequeue from front). Example: stack = plate stack, queue = people waiting in line at a ticket counter.
